Company

Intro

The goal of a dining tip calculator is to automatically calculate a dining tip total or percentage for a customer, employee or employer. When at a restaurant, a customer may need to know how much their total will be by inputting their total bill, percent of tip, and number of people sharing that bill. The customer is unable to ask the waitress to do it, the employee would have to go through the same steps after asking the customer how much they would like to tip, if at all. If an employee wants to see their average tip percentage for their employees they could also calculate by scrolling to the bottom and inputting the information requested. The functions include adding a tip percent option including 10% 15%, 20% or custom amount to the final bill. The final amount can be paid by as many as one person or six people. If a user enters an amount that is not between 1 and 6, an error message pops up prompting them to try again. The calculator outputs a tip and bill amount for each player. Above is an image of the first rough draft of the calculator encompassing all the basic functions of the tool.
